

Requirement Analysis

1. Analysis of Target User Needs

The biggest problem in the current job market is not a lack of information, but rather "information overload coupled with mismatching." Based on this observation, we break down user needs as follows:

Candidates: Say Goodbye to Needle in a Haystack

The most frustrating thing for job seekers is often submitting applications aimlessly or having their resumes disappear into a black hole. What they need now is no longer simple keyword matching, but a system that can understand their technical depth and provide precise job postings, saving them time sifting through a massive number of useless applications.

Employers: Reject Inefficient Screening

For employers, the most painful thing is being overwhelmed by many unsuitable resumes. What they need is not another recruitment dashboard, but a smart mechanism that can achieve "two-sided optimisation." The system should be able to directly identify the top 10 most suitable candidates, which can truly reduce communication costs and substantially improve interview conversion rates.

Trust and Privacy Needs: Returning to the Essence of Privacy

Both parties crave a safer and more transparent environment. This means minimising unnecessary third-party intervention and ensuring that sensitive information, such as contact details and work experience, is strictly protected, rather than simply throwing data into a black box.

2. Major Functional Needs

To address the core challenges, the following major functional needs have been identified:

Structured Information Management: The system must capture detailed profile data for candidates and comprehensive Job Descriptions for employers.

Search and Discovery: Candidates must be able to search via keywords from Job Descriptions, and employers must be able to filter candidates by specific criteria like skill and education.

Two-way Intelligent Matching: The system must implement recommendation algorithms to provide the Top-K (K=10) most relevant jobs for candidates and the Top-N (N=10) most suitable candidates for employers.

3. User Stories

ID	As a/an	I want to.....	so that.....
US 1	Candidate	create and edit my profile	my background is stored for matching
US 2	Candidate	search for jobs via keywords or browse the full list	I can find interesting opportunities
US 3	Candidate	I want to see a "Top-10 Recommended Jobs" list	I can focus on the best matches for my skills.
US 4	Employer	create job postings with specific requirements	candidates can apply
US 5	Employer	filter candidates by their education and skills	I can manually find talent
US 6	Employer	see the "Top-10 Best Candidates" for my job post	I can hire efficiently
