

Target Users

There are two different users, candidates and employers.

Candidates are people who are looking for jobs. In many current recruitment platforms, it is not easy for them to find jobs that really match their skills. However they apply for a lot of positions but still get no response. Also, many job recommendations are not very well. Because of this, candidates need a system that can better understand where they need and give more suitable job suggestions. Another problem is that some systems are a bit complicated, so it is hard for users to clearly find the companies they want. Since every candidate is different, more accurate matching is very important.

Employers are companies or recruiters who want to hire people. Usually, they receive many applications, but quite a few of them are not suitable. It is not matching real want. This makes the hiring process slower and less efficient. Employers need a system that can help them find suitable candidates faster, instead of checking every resume one by one. Cause waste time for each other. A better choice process is important, because it can save time and help HR make more reasonable decisions.

Overall, this system is designed to help both candidates and employers improve the matching process, so they can find more suitable results more easily and save time.
